In order to be able to fit the CRT screen, CF160 flanges were chosen for the test chamber. At one point during testing major changes were made, resulting in a differentiation by iteration.

1.1 First iteration

A 3D render of the chamber is shown in (fig. 1.1).

1.1.1 Parts

The center piece consists of a 6-way cross with view ports at the front and bottom. A valve was installed at the back in order to flood the chamber with nitrogen when installing a new CRT to avoid oxygen poisoning. On the right side, a HiCube 300 Eco turbo pump was installed and on the left side a wobble stick was attached with a wire. A nipple fitting was installed at the top with a 5 port cluster flange, each being of type CF63.

name?

length

In the middle port, a VSH vacuum transducer was installed to measure pressure. This needs a 24 V dc power supply. On the left, a 19 pin connector was installed to supply the necessary voltages to the CRT. Two flanges were equipped with four BNC feedthroughs each. One of them was used to connect do the x-, and y-plates, while the

other connected to the wobble stick and aluminum foil at the CRT screen. Further explanation will be given in . The last port was capped off by a blank flange.

For the inside wires, stranded copper cables were used. The chamber was sealed by rubber gaskets.

Figure 1.1: 3D rendering of test chamber.

1.1.2 CRT mounting mechanism

Two M8 rods of length were drilled into the cluster flange. On each, a L-piece was installed between two nuts and they were connected by an hose clamp. Two of these were used to secure the CRT inside the nipple facing the cross (fig. 1.2).

1.1.3 Leak test

Before inserting a CRT, a leak test was performed. First, the chamber was set to a pressure of 10^{-5} mbar after which the pump was turned off. The pressure was measured once a minute for a duration 3 h. The plot is shown in fig. 1.3.
